

Inventory Recertification

Have confidence that your spare parts are operational and reliable

Are you certain that the spare parts on your storeroom shelves will work when you put them into production? Rockwell Automation Inventory Recertification program helps you avoid costly downtime by providing testing and repair of your spare parts. This cost-effective service confirms the integrity of your products and allows you to send repairable Allen-Bradley® parts* to our certified remanufacturing facilities for inspection and comprehensive pass/fail testing.

This service validates and repairs your suspect inventory when you're facing the following conditions:

- Broken seals or open boxes in storeroom
- Environmental exposure (temperature, humidity, vibration, electro static, etc.)
- Extended or unknown length of time on the shelf (component life concerns)
- Suspect inventory (repair work performed by unauthorized companies).

Units that pass all testing are repackaged and returned with a one-year warranty. Any units that do not pass will be remanufactured to factory specifications, recertified, and returned with a one-year warranty.

How it works:

- 1 Send in the suspect units for testing.
- 2 Rockwell Automation tests in our certified remanufacturing facilities.
- 3 Units that pass are returned to you. Units that fail are remanufactured, recertified and returned.

**Some exceptions may apply.*

Benefits

- Non-operational spare parts are remanufactured to like-new condition, complete with firmware updates
- Increase the integrity of spare parts inventory
- Minimize costly downtime of production by knowing you have working spare parts
- One year remanufacturing warranty included
